The frequency data for USAREUR soldiers who participated in a survey conducted by the Walter Reed Institute of Research (WRAIR) are summarized. These data are part of an on-going, Army-wide study of psychological issues associated with Operation Desert Storm/Shield (ODS/S). All respondents, 3720 soldiers and 544 leaders, had been deployed to Southwest Asia during ODS/S. This survey was conducted nine months after ODS/S. The frequency data on individual survey items are presented for both soldiers and leaders. Summaries are also provided for each section of the survey.

DTIC QUALITY INSPECTED

INTRODUCTION

1. Purpose. This report summarizes post-combat survey data for USAREUR soldiers who participated in a study conducted by the Walter Reed Army Institute of Research (WRAIR). These data are part of an Army-wide WRAIR study of psychological issues associated with Operation Desert Shield/Storm (ODS/S).

2. Contents.

a. General. This report contains information on the individual survey item responses of 3720 USAREUR soldiers in the ranks of private to staff sergeant and 544 USAREUR leaders in the ranks of Sergeant First Class to Lieutenant Colonel. All of these soldiers and leaders were deployed to Southwest Asia during ODS/S. The survey was conducted in USAREUR by WRAIR during November and December 1991, approximately one year after the operation.

Soldiers and leaders were given slightly different versions of the survey, reflecting their particular situations and concerns. Both sets of data are reported where applicable, with soldier data identified as "SLD" and leader data identified as "LDR." Frequencies are computed separately for the two data sets and may not sum to 100% for either data set due to rounding off numbers. In interpreting the survey results, it may be useful to note that at the time of the survey, all of these respondents were aware of announced or rumored inactivation, redeployment and/or reflagging of their units.

b. General Findings Report (GFR). The GFR contains the frequency data on individual items contained in the WRAIR survey. Summaries are provided at the beginning of each section.

3. Survey Methodology. Survey respondents were from combat and combat support battalions in three major USAREUR units (total N = 4657). At least 50% of the soldiers and leaders in each battalion participated in this survey. Only responses from soldiers who deployed to ODS/S (N = 4264) are presented here. The survey was voluntary and respondents signed a volunteer consent form.

4. Analysis.

a. WRAIR analyses of these and other Army data are being disseminated as they become available. Reports of findings have been made in the form of briefings, research reports, and published articles. Contact USAMRU-E for additional information about analyses.

b. This report was compiled and edited by Mark A. Vaitkus, USAMRU-E. Statistical data were generated by Fred Mullins, HQ USAREUR ODCSPER, PA&E Office. Narrative material was provided by James A. Martin, USAMRU-E, and Amy Adler, Ph.D., University of Maryland - European Division, on contract to USAMRU-E. Additional support was provided by Linda L. Bell, USAMRU-E.

DEMOGRAPHICS OF SURVEY RESPONDENTS

The demographic portion of the survey was designed to get a description of the personal and military characteristics of the soldiers and leaders.

The mean age of soldiers was 23 years, with a range of 18 to 46. The leaders were older, with a mean age of 32, and a range of 21 to 51 years. The modal rank of soldiers was specialist and corporal (48%); the modal rank of leaders was sergeant first class (34%). The majority of respondents were white, although there was a greater racial diversity among soldiers than leaders. Almost all respondents were male (99%) as was expected given that the survey was designed for combat battalions. About half of the soldiers were married, and 43% reported being single. Leaders were more likely than soldiers to report being married (74%). Forty-five percent of soldiers and 60% of leaders reported having at least one child. In terms of educational achievement, 39% of soldiers reported at least some college education compared with 87% of leaders.

Almost all respondents were active duty prior to deployment to Southwest Asia and had been for more than a year. Still, at the time they deployed, many soldiers (23%) and leaders (19%) had been in their company for three months or less.

A. Age of respondents on last birthday:

c. 7-12 months:	26%
d. 13-18 months:	17%
e. 19-24 months:	7%
f. > 24 months:	5%

LEADERSHIP

The goal of the leadership items, which were administered only to soldiers, was to assess soldier perceptions of their leaders. Over a third of the soldiers rated the effectiveness of their current company-level leaders "above average" to "high", ranging from 35% for the platoon leader (item 3) to 51% for the squad/section leader (item 1).

At the time they deployed, more than 30% of these soldiers had served with their company-level leaders for less than four months, while less than 24% served with any company leader for more than 12 months (items 6-10).

HOW EFFECTIVE A LEADER IS:

10. Your Company Commander.	98%	32%	21%	26%	14%	5%	2%

FAMILY AND SINGLE SOLDIER ISSUES

Satisfaction with the military's social environment was assessed through questions about family and single soldier life. Soldier satisfaction with family life (items 11 through 15 only) ranges from 30% to 38% either "satisfied" or "very satisfied." Leader satisfaction ranges from 57% to 74% either "satisfied" or "very satisfied." Rates of dissatisfaction for soldiers range from 27% to 41% either "dissatisfied" or "very dissatisfied" with how the Army has an impact on family life. Leader dissatisfaction ranges from 12% to 29% "dissatisfied" or "very dissatisfied."

In terms of the effectiveness of the unit's rear detachment in taking care of single soldier needs (item 16), 19% of soldiers and 29% of leaders were "satisfied" or "very satisfied." Forty-one percent of soldiers and 23% of leaders were "dissatisfied" or "very dissatisfied."

Besides single soldier concerns, family concerns were also assessed. In general, soldiers expressed confidence that their families would be taken care of by the rear detachment. Most soldiers (60%) and leaders (78%) reported that during their deployment to ODS/S, they had "moderate" to "very high" confidence that their families would be taken care of if they were wounded or killed (item 18). In terms of family support groups, 71% of soldiers and 78% of leaders reported they had at least "moderate" confidence that their unit's family support group would help their family if needed (item 19). Both soldiers and leaders were somewhat less confident in the rear detachment providing help (item 20), with 60% of soldiers and 70% of leaders expressing at least "moderate" confidence. Also, 85% of soldiers and 91% of leaders were confident that their families were safe back home (item 21).

NOTE: Soldiers and leaders were asked to answer each question regardless of their marital status.

IMPACT OF EVENT

These 15 items represent the "Impact of Event" scale, a measure of psychological distress commonly used in the study of exposure to a traumatic event.

The items that compose this scale are thought to represent the two principal components of psychological response to trauma: INTRUSION (represented by experiencing unwanted thoughts about the event) and AVOIDANCE (represented by attempts to stay away from reminders of the event).

The most-reported symptom was thinking about ODS without meaning to, a symptom of intrusion. Seventy-three percent of soldiers and 71% of leaders reported having this experience (item 22). More than half the respondents also reported avoiding getting upset when thinking about ODS (item 23), pictures of ODS popping into their minds (item 30), other things making them think about ODS (item 32), and any reminder bringing back feelings about ODS (item 35). In addition, more than half of the soldiers also reported that they had waves of strong feelings about ODS (item 26).

The least-reported symptoms for soldiers were sleep disturbances and staying away from reminders of ODS. Only 38% of soldiers reported having these experiences (items 25 and 31). The least-reported symptom for leaders was staying away from reminders of ODS. Only 27% of leaders reported this experience (item 31).

Overall, respondents reported more intrusion symptoms than avoidance symptoms, and soldiers reported more symptoms than did leaders. Detailed analysis and interpretation of these data are provided elsewhere (contact USAMRU-E for additional information).

SLD: 99%	57%	19%	18%	6%	
LDR: 99%	66%	15%	14%	5%	

COHESION AND MORALE

These items reflect the soldier's assessment of his/her unit TODAY. They cannot be used to interpret cohesion or morale during ODS/S. The items are used by the WRAIR to construct measures of horizontal cohesion, the level of perceived support from fellow soldiers, and vertical cohesion, the level of perceived support from the chain of command. The goal of the survey is to assess unit-based social support. Leaders did not receive these items on their survey.

In terms of vertical cohesion, or perception of leaders, 40% of soldiers agreed with the statement "My superiors make a real attempt to treat me as a person" (item 47). The lowest level of agreement to a statement was found with "I am impressed with the quality of leadership in this company" (item 44); only 16% of soldiers agreed with this statement. In terms of other leadership qualities, 38% of soldiers expressed confidence in their company commander's ability to lead the unit in combat (item 66), and 33% agreed they would go to people in the company chain of command for help with a problem (item 45).

Other cohesion questions addressed perceptions of NCOs. Forty-seven percent of soldiers expressed confidence in their NCOs' ability to lead well in combat (item 50). Forty-four percent agreed that their NCOs are interested in their personal welfare (item 60). Thirty-nine percent of soldiers also agreed that NCO's get good cooperation from company soldiers (item 39).

In terms of social cohesion among peers, or horizontal cohesion, 36% agreed that there is a lot of teamwork among soldiers in their company (item 37), 46% agreed they spend a lot of their non-duty time with other company members (item 42), and 40% reported that their closest relationships are with their co-workers (item 43). Fewer soldiers reported more general company cohesion. Only 20% of soldiers agreed that in their company "people really look out for each other" (item 48), and only 21% agreed that "Most of the people in this company can be trusted" (item 46).

When it comes to combat, a different pattern emerges. Forty-two percent agreed with the statement "Soldiers in this company have enough skills that I would trust them with my life in combat" (item 51). Fifty-one percent of soldiers also expressed confidence that "If we went to war tomorrow, I would feel good about going with my squad" (item 63) and 46% would feel good about their platoon (item 64). The highest rating, however, was 78% agreement that "I am well trained to go into combat" (item 68).

SOURCES OF SUPPORT

These items were developed by WRAIR to assess types of support soldiers and leaders might use to deal with deployment and combat stressors.

The most frequently acknowledged sources of support (and the most helpful) were confidence in own abilities (item 81), thoughts of family back home (item 85), and remembering training (item 82). Other helpful supports, for those who used them, include prayer or meditation (item 78), other soldiers in the platoon (item 87), best buddy (item 89), confidence in the superiority of weapons (item 90) and training (item 91), and checking/rehearsing plans and orders (item 88). Fewer respondents reported using chain of command sources of support (items 70-77). Soldiers and leaders reported using similar sources of support.

Although there is considerable variation among the individual items (in use and usefulness), when a soldier used a source of support from this list, it was usually rated at least moderately helpful.

COMBAT EXPOSURE

These 26 items were developed by the WRAIR to assess the range and intensity of possible combat stressors experienced by soldiers and leaders in ODS/S. Any analysis is complicated by the fact that most soldiers experienced more than one exposure type (e.g., "I saw an American soldier wounded by the enemy" and "I had a buddy get wounded or injured") and there are a wide variety of exposure combinations.

The most frequently acknowledged exposure was "I served in a unit that fired on the enemy" (80% of soldiers, 82% of leaders; item 93). The least frequent was "I flew in an aircraft that was shot at by the enemy" (2% of soldiers and 1% of leaders; item 94).

A number of soldiers and leaders did report combat-related experiences that they rated "quite" or "extremely" stressful. These include: seeing an American soldier wounded by the enemy (19% of soldiers and leaders; item 108), killed by the enemy (11% of soldiers and leaders; item 109), wounded by friendly fire (23% of soldiers and 25% of leaders; item 110), killed by friendly fire (15% of soldiers and 17% of leaders; item 111), having a buddy killed or wounded (13% of soldiers and 8% of leaders; item 113), and seeing civilians killed or wounded (35% of soldiers and 38% of leaders; item 106). Other experiences that were also stressful for many soldiers and leaders were being pinned down (23% of soldiers and 14% of leaders; item 117), and receiving incoming artillery, rocket, or mortar fire (37% of soldiers and 38% of leaders; item 96). Most soldiers (65%) and leaders (68%) saw an enemy soldier killed or wounded (item 105), although this was rated as less stressful than other events.

STRESSORS

These 37 items were developed by the WRAIR to assess residual ODS/S stress as well as CURRENT stressors affecting USAREUR soldiers. Items represent such areas as personal stress (e.g. relationships and finances), unit stress (e.g. relationship with chain of command), USAREUR drawdown stress (e.g. unit inactivation plan), and residual effects of ODS/S (e.g. ODS combat experiences).

By far, the most frequently reported stressor is "The way things are usually done in my unit." Eighty-eight percent of soldiers and 90% of leaders report that this produces at least "a little bit" of stress (item 131). Their unit's current inactivation plan (item 132) was also reported as at least "a little bit" stressful by 65% of soldiers and 71% of leaders. In a related issue, being able to stay in the Army despite force reduction was reported as at least "a little bit" of a stressor by 52% of soldiers and 64% of leaders (item 145). Being able to get civilian job skills or additional education was also reported as at least "a little bit" of a stressor by 72% of soldiers and 70% of leaders (item 151).

Financial matters were reported as at least "a little bit" stressful by 76% of soldiers and 72% of leaders (item 142). Relationship with wife or girlfriend since ODS was reported as at least "a little bit" stressful by 47% of soldiers and 40% of leaders (item 129). Soldiers were also somewhat more likely than leaders to report that deployment to ODS (item 119) as at least "a little bit" stressful (52% vs. 37%).

When asked to assess the effect of all these current stressors, 20% of soldiers and 17% of leaders report that these stressors are affecting their personal life "quite a bit" or "extremely." The stressors are reported to affect military performance even less: 8% of soldiers and 6% of leaders report current stressors affecting performance at least "quite a bit." Overall, 90% of soldiers and 95% of leaders report that they are coping with these stressors at least "moderately" well.

155. Over the past two weeks how well have you coped with these stresses?	SLD: 98%	2%	8%	28%	42%	20%
	LDR: 99%	1%	4%	19%	53%	25%

BRIEF SYMPTOM INVENTORY

These items comprise a psychological health measure commonly used in civilian studies. The Brief Symptom Inventory (BSI) contains a number of individual sub-scales (e.g., Depression, Anxiety, etc.,) that help provide a broad assessment of psychological status, as well as an overall Global Severity Index (GSI) that provides a useful summary measure of psychological distress.

The BSI measures current psychological symptoms. It is not a personality measure. The BSI is a reliable and valid measure of psychological distress, but there are no norms for an active duty military population.

Overall, the range of soldiers in this sample reporting at least "a little bit" of discomfort on any one of these items is from 60% ("Feeling easily annoyed or irritated", item 164) to 10% ("Spells of terror or panic", item 208; and "Thoughts of ending your life", item 168). For most of the individual items, less than 10% of those responding indicate that they are experiencing "quite a bit" or "extreme" discomfort.

Leaders report a similar range of symptoms although of less intensity than do soldiers. The range of leaders in this sample reporting at least "a little bit" of discomfort on any one of the items is from 61% ("Feeling easily annoyed or irritated", item 164) to 3% ("Feeling afraid in open places", item 166).

Additional symptoms tapping a range of psychological complaints include at least "a little bit" of discomfort from "feeling blue" (40% of soldiers and 36% of leaders, item 177); having urges to beat, injure or harm someone (39% of soldiers and 21% of leaders, item 202); sleep that is restless and disturbed (39% of soldiers and 32% of leaders, item 203); and feeling that people will take advantage of you if you let them (50% of soldiers and 41% of leaders, item 214).

HOW MUCH DISCOMFORT HAVE EACH OF THE FOLLOWING CAUSED YOU DURING THE PAST WEEK?
